

I am withdrawing my money from my savings

BACKGROUND

Current age	40	Experience investing	Less than 1 year
Current plan value	\$100,000	Knowledge	Advanced
Reporting currency	\$ (USD)	Investment decision maker	Professional/fund manager
Intention	Annuity	Income per annum	\$15,000
My personal risk profile	2	Contributions per month	0.0% / \$0
		Main source of retirement income	Yes

TIME HORIZON

I am currently 40 years old and plan to retire/leave service when I am 40

LIQUIDITY

Over the next three years I might need to withdraw a percentage of my portfolio as cash, up to 77%

I chose these answers to the survey questions on markets...

GROWTH

I would like my money to grow in a balanced way

POTENTIAL FALLS

If markets are poor, I am prepared for my \$100,000 investments to fall to \$45,000 and recover over 5 years

MISSING OUT

If I invested \$10,000 and the global stock market doubled in five years, I would be satisfied with a portfolio value of \$18,000

Projected plan value at retirement

Your personalised projections are based on your plan information and survey responses to illustrate possible financial outcomes. Please note that financial forecasting involves uncertainty, and there is no guarantee for these projections. Please read the *Disclaimer* at the end of this report.

WHERE AM I TODAY...

Retirement income goal \$20,000

Will I make my goal?

	Plan value	Annual income	Income goals met?
GOOD 	\$100,000	\$1,160	
TYPICAL 	\$100,000	\$1,130	
POOR 	\$100,000	\$1,090	

My risk profile

Based on your selections, your attitude to risk is:

Defensive	Cautious	Balanced	Moderate	Adventurous	Aggressive
1	2	3	4	5	6

What does 'Cautious' mean?

You are prepared to take only a small amount of investment risk. You wish to prioritise preservation of capital over high returns.

Suggested asset mix

Cash	50%
Fixed Income	50%
Equity	0%
Aggressive growth	0%
Specialist assets	0%

What do the risk profile numbers mean?

In investing, the risk-return trade-off means that to potentially make more money (returns), you have to be willing to accept more uncertainty (risk). And if you want less risk, you are likely to see smaller returns.

Someone with a risk profile of 6 is willing to accept a higher level of uncertainty than someone with a risk profile of 1.

To measure risk in Concerto we use a European standard, called the Summary Risk Indicator (SRI). The SRI appears on investment products in Europe and captures risk attributes like credit risk, market risk and liquidity risk.

Our analysis maps your risk profile to an overall SRI score between 1 and 6. A risk profile of '1' indicates that a cash portfolio of investments is suitable. A '4' indicates suitability for an overall higher-risk portfolio, one

that might hold a high proportion of equities.

We group types of investments together and call them asset classes. From least risky to most risky: cash, fixed income, equities, aggressive growth assets and specialist assets.

When you invest in a range of different asset classes, you can spread your risk (diversify) across investments that behave differently in different market conditions, while still making returns.

Your survey result risk profile number refers to your overall portfolio. Individual funds in your portfolio might have a higher or lower number than your survey result. Holding a range of funds with different attributes is likely to help you spread your risk.

RISK PROFILES - ASSET ALLOCATION

		MORE RISK 					
		Defensive 1	Cautious 2	Balanced 3	Moderate 4	Adventurous 5	Aggressive 6
 MORE RISK	Cash Stable, retains value but if inflation is high, real value will decline. Short-term & emergency funds	100%	50%				
	Fixed income A 'loan' to a government or company. Predictable income (interest) and repayment of your initial investment		50%	55%	5%		
	Equity Diversified investment in companies traded on stock exchanges.			45%	90%		
	Aggressive growth assets This includes: • Concentrated investment to a particular company, industry or sector • Private equity - investing in companies which are not listed on public stock exchanges.				5%	100%	40%
	Specialist assets 'Alternative' investments and riskier strategies, including: • Using leverage (borrowing money) to invest • High-risk hedge funds • Concentrated real estate • Concentrated commodities						60%
	Risk tolerance You are prepared to take...	no investment risk, as far as possible.	only a small amount of investment risk.	a limited investment risk to increase chance of achieving a positive return.	a moderate amount of investment risk in to increase the chance of achieving a positive return.	a medium degree of risk in return for the possibility of improving longer term investment performance.	a substantial degree of risk with your investment in return for the prospect of the highest possible longer term investment performance.
	If...	you are likely to need a large portion or all of your money soon.	you wish to prioritise preservation of capital over high returns.	you only wish to risk a small part of capital to achieve positive returns.	capital protection is less important to you than achieving a better return on your investment.	short term capital protection is not important to you, and you are willing to sacrifice some long-term protection for the likelihood of greater returns.	you appreciate that over some periods of time there can be significant falls, as well as rises, in the value of your investment and you may get back less than you invest.

DISCLAIMERS
